

The Clear Way to Convey®

Recently, in addition to our food grade stainless steel systems, Cablevey has released a new conveyor on the market more suitable for materials that contain natural oils. Certain natural oils like those produced by peanuts and tree nuts might affect stainless steel adversely, and therefore some materials are better conveyed through our exclusive plastic tubing.

Our Clearvey™ Systems allow materials to move through our tubing with no adverse effects. These systems are designed with the same clean, efficient and gentle handling as our stainless-steel systems.

Cablevey's Clearvey™ Systems have proven to accommodate a wide range of materials beyond peanuts and tree nuts and the clear tubing allows the user to view the material moving through the tube ensuring proper conveying. The Clearvey™ system offers both wet and dry tube conveyor cleaning options.

Clear

Food-contact grade polymer tubes prevent the rub marks that stainless steel sometimes produces. The clear resin allows visual observation of the product's movement without risk of contamination.

Wet

Conveyors come with built-in water fittings for quick, clean-in-place operations. Tube material is compatible with most cleaners and sanitizers made for food equipment.

Dry

Fixed brushes, moving brushes, moving sponges, and squeegees can all be used to dry clean-in-place.

Clean

Renewable

Efficient

Our Clearvey™ Systems allow materials to move through our tubing with no adverse effects.
